# Seismic performance quantification by ATC-63

- performance quantification by cyclic tests  
or
- Applied Technology Council, Project 63
- achieves primary life safety performance objective by requiring an acceptably low probability of collapse
- $R$ ,  $\Omega_0$ ,  $C_d$  factors
  - 1) idealized archetypical systems: realization, design (assume  $R$ )
  - 2) analytical model development and calibration
  - 3) nonlinear static (pushover) analysis  $\rightarrow \Omega_0$
  - 4) nonlinear incremental dynamic analysis (IDA)
  - 5) fragility curves;  
**adjusted collapse margin ratio (ACMR) vs. acceptable ACMR**

↓

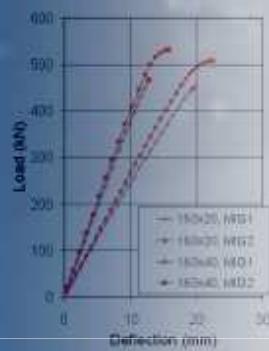

$R$ ,  $C_d$

# Performance quantification

- $R = 4 !$

- results and component behavior are very similar to wooden shear wall – as good as wood
- $R = 6$  is in code for wooden shear wall
- additional finishing, partition walls?

- short period bldgs!
- ASD design strength derivation from test

- uncertainties in the monotonic backbone estimation
